

QMS Training: Verification and Validation Questions

Clinical Scientific Computing

1. What are the key differences between the verification and validation processes in medical software development?
2. What different methods of verification would you conduct throughout a project?
3. How would you trace back a solution to a risk control identified in the hazard log, in the documentation to prove that it has been correctly implemented?
4. What are the key differences between the content of:
 - a. A User Requirement item
 - b. A Design Specification item
5. If a design specification item cannot be unit-tested (automatically) it must be manually tested. Is this manual test a validation test or a verification test?
6. At what stage of development are validation tests performed and why?
7. Who performs validation tests?
8. The acceptance criteria require that all verification and validation test have passed. How are should these results be presented and approved by the 'customer'?
